Project title: EduGenie-Google Gemini Powered Learning Assistant

Phase 1: Brainstorming and Ideation Phase

1. Brainstorming & Ideation

-The brainstorming and ideation phase was the initial stage of developing the EduGenie: Google Gemini Powered Learning Assistant. The main purpose of this phase was to identify the common difficulties faced by students during their learning process and find a suitable technology-based solution.

-Students often face difficulties in understanding complex concepts, finding quick answers, preparing for examinations, revising lessons, and generating practice questions. Traditional learning methods may not always provide immediate and personalized support. Therefore, we discussed the possibility of using Generative Artificial Intelligence to create an intelligent learning assistant.

-After discussing different ideas, we decided to develop EduGenie as an AI-powered educational assistant using Google Gemini. The application is designed to understand student queries and generate meaningful responses based on the user's input.

2. The major ideas identified during brainstorming were:

-AI-based question and answer system

-Simple explanation of difficult concepts

-AI-generated quizzes for practice

-Summarization of learning content

-Personalized learning assistance

-Interactive student-AI communication

-Fast and easily accessible educational support

The final idea selected was EduGenie – Google Gemini Powered Learning Assistant, which combines Generative AI with an educational application to provide students with a smart and interactive learning experience.
