Project title: EduGenie-Google Gemini Powered Learning Assistant

Phase 3: Project Design Phase

1. Project Design Phase:

-The project design phase defines the architecture, workflow, modules, and interaction between different components of EduGenie.

-The application follows a client-server architecture. The student interacts with the frontend interface. The frontend sends the request to the FastAPI backend. The backend processes the request and communicates with the Google Gemini AI model. The generated response is then returned to the frontend and displayed to the student.

Basic System Workflow:

Student → Frontend → FastAPI Backend → Google Gemini AI → Generated Response → Student

-The project is organized into different modules so that individual learning activities can be managed effectively.

Major Components

Frontend:

-Provides the user interface through which students can enter questions and view AI-generated responses.

Backend:

-FastAPI is used to create the backend and handle requests from the frontend.

AI Integration:

-Google Gemini is integrated into the application to generate intelligent and context-based responses.

Learning Modules:

-Different modules are used to provide learning-related functions such as explanations, quizzes, questions, and summaries.

-The modular design makes the project easier to understand, maintain, test, and extend in the future.
